

# GET CLINICIANS BACK TO THEIR PATIENTS

## Health systems in transition

There is an increased focus on quality of care driven by value-based care, which is linked to the amount of time clinicians spend with patients.<sup>1</sup>

**Focus on quality for patient care**

**Shortage of clinical staff**

**Support**

- Safety
- Patient satisfaction
- Financial performance

Across the continuum of care

## It's more than you think

Is the amount of time your clinicians spend on supply chain activities really manageable?

How much is it interfering with their responsibilities to their patients?

Various studies show that clinical staff in procedural units typically spend 2.5 to 3 hours of their shift performing supply-related tasks.

of clinicians time is spent performing supply-related tasks<sup>2</sup>

## New way to reduce clinicians' time on supply chain activities

Progressive healthcare supply chain departments allow clinical staff to focus on patient care by streamlining and automating inventory tasks, including monitoring for expired products. WaveMark™ supply management and workflow solutions, an RFID-based technology, can help you automate key inventory management processes, removing the redundant manual inventory tasks clinicians perform today.

The cloud-based solution interfaces with clinical documentation and other information systems to streamline data capture, alert you to expirations and recalls, and free up your clinical staff to spend time with patients rather than manually performing inventory tasks.

- Store**  
Items are registered and RFID tags are applied (or arrive pre-tagged) then stored in Smart Cabinets
- Use**  
Clinicians retrieve items and wave them at the point of use stations to link items to patients
- Replenish**  
Links to purchasing system while clinical documentation system triggers reorders and suggests appropriate par levels
- Analyse and optimise**  
Powerful real-time operational analytics for transparency and visibility
